**494.45 Grams per Tonne (g/t) Silver, 2.08 % Lead and 2.25 % Zinc over 6.1 Metres Intersected in the Silver Rich VMS Horizon on the BA claims.**

**Stewart, BC** – Mountain Boy Minerals Ltd. hereby report that assay results for the first 11 remaining drill holes from the 2008 exploration program on the BA property in Northwest British Columbia have been received. An additional 23 holes drilled during the 2008 field season remain to be assayed.

**Highlights of these latest results include: 54.88 metres grading 92.63 g/t silver, 0.70% lead and 1.65% zinc in DDH-2008-BA-43; 12.19 metres grading 190.5 g/t silver, 0.92% lead and 0.76% zinc in DDH-2008-BA-47; and 30.49 metres grading 190.47 g/t silver, 1.39% lead and 1.80% zinc including 6.1 metres of 494.45 g/t silver, 2.08 % lead and 2.25 % zinc in DDH-2008-BA-51.**

The mineralized zone is located in the upper parts of the Bear Glacier within the same stratigraphic horizon that hosted the Eskay Creek deposit. Since start-up in 1995, until closure in 2008, the Eskay Creek mine produced more than 100 tonnes of gold and 5000 tonnes of silver. Project geologists believe that the zone represents the upper portion of a Kuroko-type volcanogenic massive sulphide system (VMS) composed of an exhalite horizon with related zinc-lead-silver mineralization. Mineralization occurs below the main exhalite horizon and is located within mudstones, mudstone breccias and dacite breccias. Mineralized rocks vary from 20 to 80 metres in width and mineralization is exposed over 800 metres of strike length in the immediate drill area. This horizon is part of a mineralized system that has been observed on valley slopes 600 metres north of the area of recent drilling and can be traced for at least another 500 metres further north. Work to date has been confined to a small portion of a large VMS belt that has been interpreted to extend for 12 kilometres in the area of the drilling based on government mapping and sampling by the Company.

Assays results for drill holes DDH-2008-BA-39 to DDH-2008-BA-51 with assay results greater than 1 % zinc are as follows:

<b>DDH</b>	<b>From (m)</b>	<b>To (m)</b>	<b>Width (m)</b>	<b>Ag g/t</b>	<b>Pb %</b>	<b>Zn %</b>

\*\* Previously released.

DDH-2008-39 was drilled to test for folding in the VMS belt and was in the footwall to the mineralization. DDH-2008-50 and 51 were the most southerly holes drilled. In these holes, strong barite content is associated with the base metal and silver mineralization.

Mountain Boy has granted Great Bear Uranium Corp an option to acquire up to a 70% interest in the Company's BA and George Copper projects, both located 30 kilometres east of Stewart, British Columbia. Pursuant to a Binding Letter of Intent executed by the companies, Great Bear can earn an initial 50% interest in a joint venture on the BA Project by paying \$158,000 in cash and incurring \$5,500,000 in exploration expenditures on or before December 31, 2013. Great Bear can earn an additional 20% interest (for a total of 70% interest) by completing a Bankable Feasibility Study on or before December 31, 2015.

E. Kruchkowski, P. Geo., a qualified person under National Instrument 43-101, is in charge of the exploration programs on behalf of the Company. Drill core samples are assayed by Assayers Canada of Vancouver, BC. The Company uses a program of blank and standard insertion with the core samples to provide quality control on the assaying.

Mountain Boy Minerals Ltd is a Canadian based mineral exploration company whose activities are in the Stewart area of BC. It is actively exploring for gold-silver-base metals on the Silver Coin project, silver-base metals on their American Creek and Bear Valley properties as well as copper-gold in their Stewart area claims.

For further information, please contact John Thornton at 778-855-7823 or Ed Kruchkowski at 250-636-9232 or visit the website at <http://www.mountainboyminerals.ca>
